

WHAT IS CLAIMED IS:

1. An information managing system including an information managing server for distributing provided information, and a terminal for exchanging information
5 with said information managing server, comprising:
 - 10 said information managing server comprises registration means for registering information to be distributed and a code representing the information in correspondence with each other, and
 - 15 setting means for setting valid dates of the information registered by said registration means,
 - 20 said terminal having communication means for communicating with said terminal, and
 - 25 display means for displaying the information distributed by said information managing server.
2. The system according to claim 1, wherein the code includes identification information for identifying said terminal serving as a distribution destination of the information to be distributed.
3. The system according to claim 2, further comprising:
 - 15 inspection means for inspecting the valid dates of the information registered by said registration means;
 - 20 and
 - 25 notification means for notifying, of predetermined information, said terminal serving as the distribution

DRAFT

destination of information obtained from the identification information on the basis of an inspection result of said inspection means.

4. The system according to claim 2, further
5 comprising:

inspection means for inspecting the valid dates of the information registered by said registration means and presence/absence of printing of the information; and notification means for notifying, of predetermined information, said terminal serving as the distribution destination of information obtained from the identification information on the basis of an inspection result of said inspection means.

- 10 5. The system according to claim 3, wherein the
15 predetermined information includes information which prompts said terminal serving as the distribution destination to execute processing for the information.

6. A control method for an information managing system having an information managing server for
20 distributing provided information, and a terminal for exchanging information with the information managing server, comprising:

25 a registration step of registering information to be distributed and a code representing the information in the information managing server in correspondence with each other;

a setting step of setting valid dates of the

information registered in the information managing server in the registration step;

a communication step of communicating between the information managing server and the terminal; and

5 a display step of displaying the information distributed by the information managing server on the terminal.

7. The method according to claim 6, wherein the code includes identification information for identifying the
10 terminal serving as a distribution destination of the information to be distributed.

8. The method according to claim 7, further comprising:

an inspection step of inspecting the valid dates
15 of the information registered in the information managing server in the registration step; and

a notification step of notifying, of predetermined information, the terminal serving as the distribution destination of information obtained from the
20 identification information on the basis of an inspection result in the inspection step.

9. The method according to claim 7, further comprising:

an inspection step of inspecting the valid dates
25 of the information registered in the information managing server in the registration step and presence/absence of printing of the information; and

a notification step of notifying, of predetermined information, the terminal serving as the distribution destination of information obtained from the identification information on the basis of an inspection result in the inspection step.

10. The method according to claim 8, wherein the predetermined information includes information which prompts the terminal serving as the distribution destination to execute processing for the information.

10 11. A computer-readable memory which stores program
codes of control of an information managing system
having an information managing server for distributing
provided information, and a terminal for exchanging
information with the information managing server,
15 comprising:

a program code of a registration step of registering information to be distributed and a code representing the information in the information managing server in correspondence with each other;

20 a program code of a setting step of setting valid
dates of the information registered in the information
managing server in the registration step;

a program code of a communication step of
communicating between the information managing server
25 and the terminal; and

a program code of a display step of displaying the information distributed by the information managing

server on the terminal.

12. An information managing apparatus for distributing provided information, comprising:

registration means for registering information to
5 be distributed and a code representing the information
in correspondence with each other; and

setting means for setting valid dates of the
information registered by said registration means.

13. The apparatus according to claim 12, wherein the
10 code includes identification information for identifying
a distribution destination of the information to be
distributed.

14. The apparatus according to claim 13, further
comprising:

15 inspection means for inspecting the valid dates of
the information registered by said registration means;
and

20 notification means for notifying, of predetermined
information, the distribution destination of information
obtained from the identification information on the
basis of an inspection result of said inspection means.

15. The apparatus according to claim 13, further
comprising:

25 inspection means for inspecting the valid dates of
the information registered by said registration means
and presence/absence of printing of the information; and
notification means for notifying, of predetermined

information, the distribution destination of information obtained from the identification information on the basis of an inspection result of said inspection means.

16. The apparatus according to claim 14, wherein the
5 predetermined information includes information which prompts the distribution destination to execute processing for the information.

17. A control method for an information managing apparatus for distributing provided information,
10 comprising:

a registration step of registering information to be distributed and a code representing the information in a storage medium in correspondence with each other; and

15 a setting step of setting valid dates of the information registered in the storage medium in the registration step.

18. The method according to claim 17, wherein the code includes identification information for identifying a
20 distribution destination of the information to be distributed.

19. The method according to claim 18, further comprising:

an inspection step of inspecting the valid dates
25 of the information registered in the storage medium in the registration step; and

a notification step of notifying, of predetermined

1000000000000000

information, the distribution destination of information obtained from the identification information on the basis of an inspection result in the inspection step.

20. The method according to claim 18, further

5 comprising:

an inspection step of inspecting the valid dates of the information registered in the storage medium in the registration step and presence/absence of printing of the information; and

10 a notification step of notifying, of predetermined information, the distribution destination of information obtained from the identification information on the basis of an inspection result in the inspection step.

21. The method according to claim 19, wherein the

15 predetermined information includes information which prompts the distribution destination to execute processing for the information.

22. A computer-readable memory which stores program codes of control of an information managing apparatus

20 for distributing provided information, comprising:

a program code of a registration step of registering information to be distributed and a code representing the information in a storage medium in correspondence with each other; and

25 a program code of a setting step of setting valid dates of the information registered in the storage medium in the registration step.
